USER MANUAL

Generated 12 October 2026 · package version v1.7.2

Checking a customer's TIN with LHDN — user manual

This manual is for the people who **check customers' tax details** — finance, admin and sales-support staff. It needs no programming knowledge.

It shows how to ask LHDN (HASiL) whether a customer's **TIN** (Tax Identification Number) is genuine and belongs together with their **business registration number** (or, for a person, their IC or passport number), using the **Xero Bridge Test Console** page that comes with your application.

What it does not do: it does not send invoices to LHDN or to Xero, and it changes nothing about the customer. It only asks one question and shows LHDN's answer.

> **Version note.** Written against `peoplelogy/laravel-xero-bridge` v1.7.2. The screens shown are the package's own console; your application may show it under its own address. The TIN and registration number in the pictures are LHDN's published example, not a real taxpayer.

3. Step 2 — fill in the customer's details
4. Step 3 — click Validate and read the answer
5. When the page shows an error
6. The Forget token button
7. Is my check saved?
8. Good practice
9. Quick reference
10. For your administrator

Before you start

You need access to the page

The page is switched **off** until your administrator turns it on, and it is normally limited to admin users. Ask your administrator for:

- the page's address — usually your application's address followed by `/xero/console`, for example `https://your-app.example.com/xero/console`;
- an account that is allowed to open it.

If the address shows **"404 Not Found"**, the page is not switched on in that system. If it sends you to a sign-in page or says **"Forbidden"**, your account is not allowed to use it. Either way, ask your administrator.

You need three details about the customer

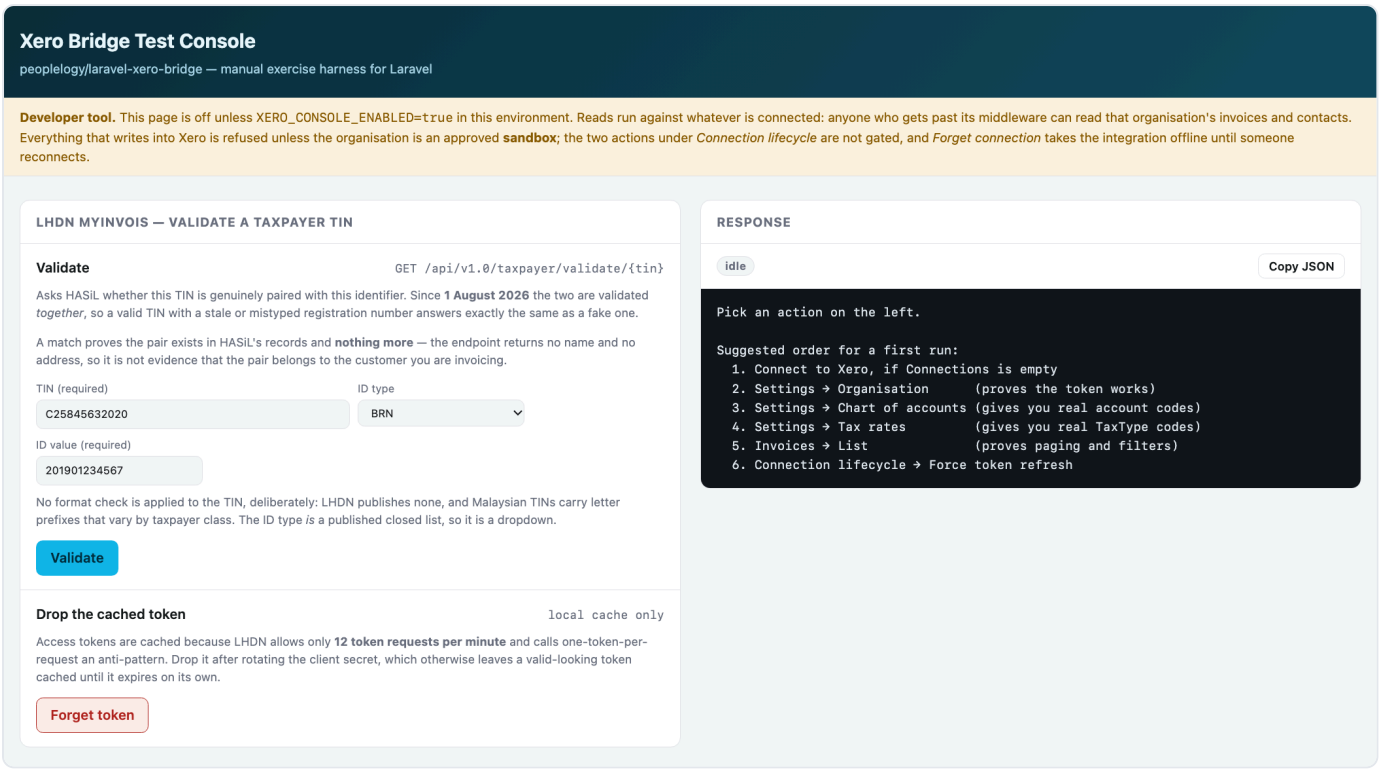

Detail	For a company	For a person
TIN	The company's tax number — usually starts with **C**, e.g. `C25845632020`	The person's tax number — usually starts with **IG**
ID type	**BRN**	**NRIC** (Malaysian IC), **PASSPORT**, or **ARMY**
ID value	The **12-digit** business registration number from the SSM certificate, e.g. `201901234567`	The IC number (12 digits), the passport number, or the army number

Type the numbers **without spaces or dashes**. For a company, always use the **new 12-digit SSM number**: an old short-format registration number will not match, even with a correct TIN.

Step 1 — open the page

Open the address your administrator gave you and sign in if asked. The page is called **Xero Bridge Test Console**. Scroll down the **left** column to the panel headed **LHDN MyInvois — validate a taxpayer TIN**.

The yellow **"Developer tool"** strip at the top is a reminder that this page is a tool for admins; it is safe to use for TIN checks.

Step 2 — fill in the customer's details

In the **Validate** section of the panel:

1. **TIN (required)** — type the customer's TIN.
2. **ID type** — choose from the list: **BRN** for a company, **NRIC**, **PASSPORT** or **ARMY** for a person. It starts on BRN.
3. **ID value (required)** — type the registration, IC, passport or army number that goes with that ID type.

The light grey numbers you see in empty boxes (`C25845632020` , `201901234567`) are **only examples** of the format. They disappear when you type. If you leave a box showing grey text, nothing has been entered.

Both numbers are needed. LHDN checks the TIN and the ID number **as a pair**: a genuine TIN typed with the wrong registration number gets the same answer as a made-up one.

Step 3 — click Validate and read the answer

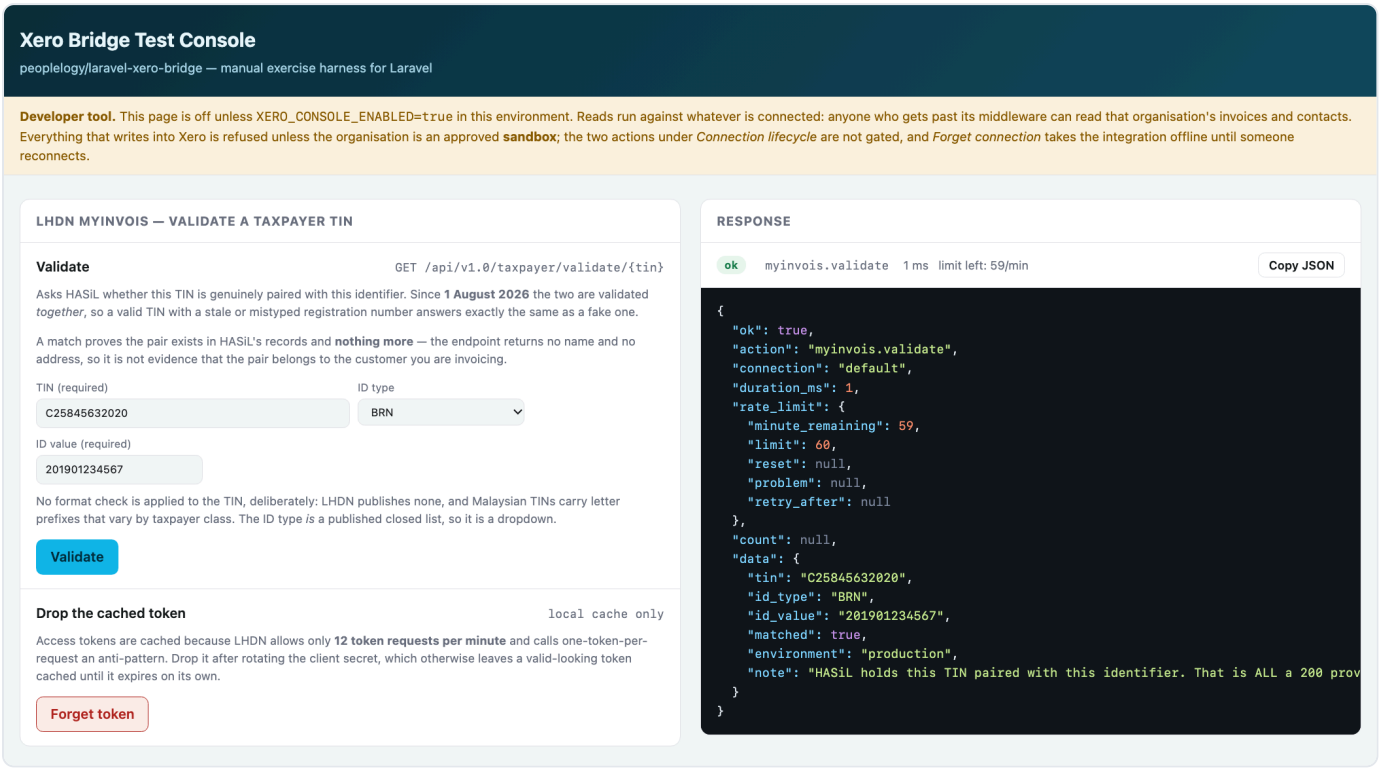

Click the blue **Validate** button. The answer appears within a few seconds in the **Response** panel on the **right**.

At the top of the Response panel is a coloured label:

- a **green** `ok` means LHDN answered — read `"matched"` in the box underneath for the answer;

- a **red label** means LHDN could not give an answer — see When the page shows an error.

Answer: Match — `"matched": true`

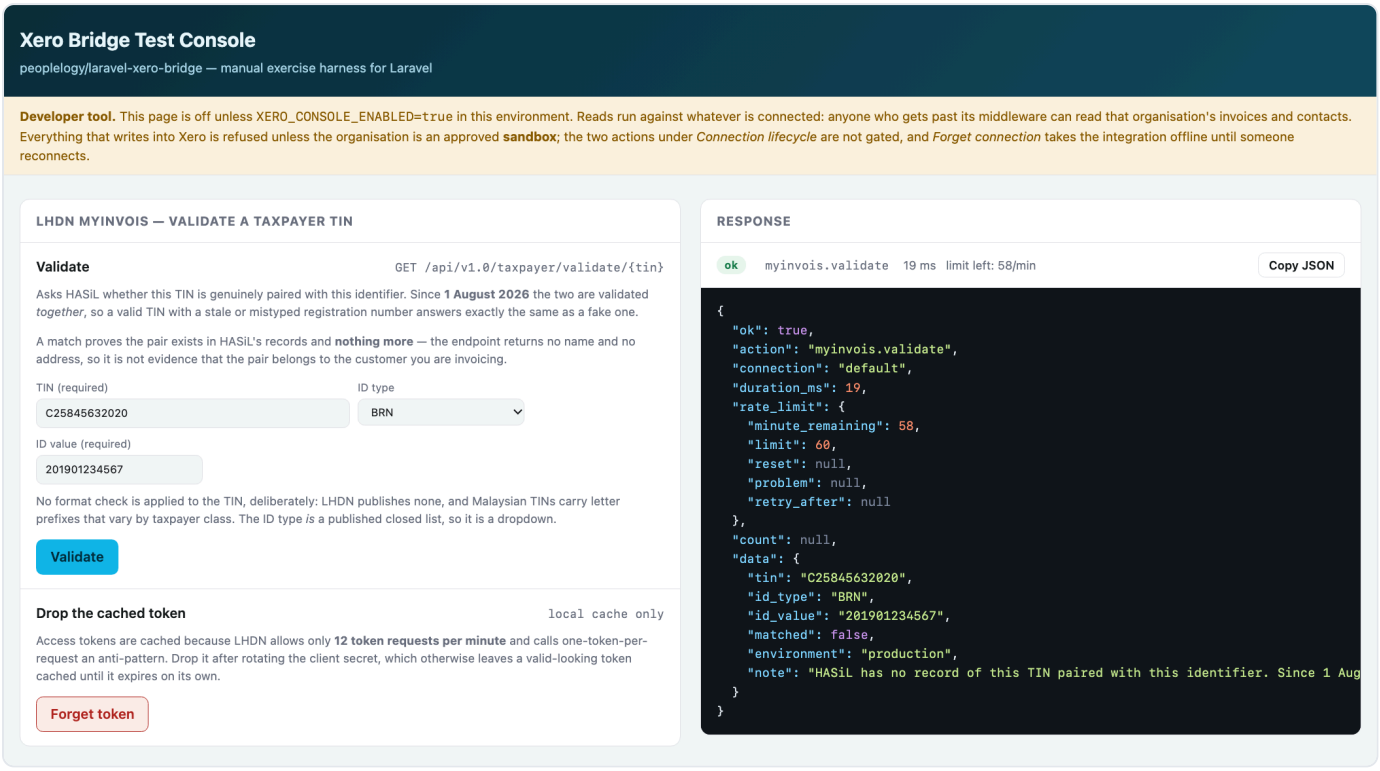

What it means: LHDN holds this TIN together with this registration (or IC/passport) number. The details are genuine and belong together.

What to do: you can use these details on the customer's record and invoices.

One caution: a match does not tell you **whose** numbers they are — LHDN returns no name or address. If you have any doubt that the numbers belong to *this* customer, compare them with the customer's own SSM certificate or e-invoice details.

Answer: No match — `"matched": false`

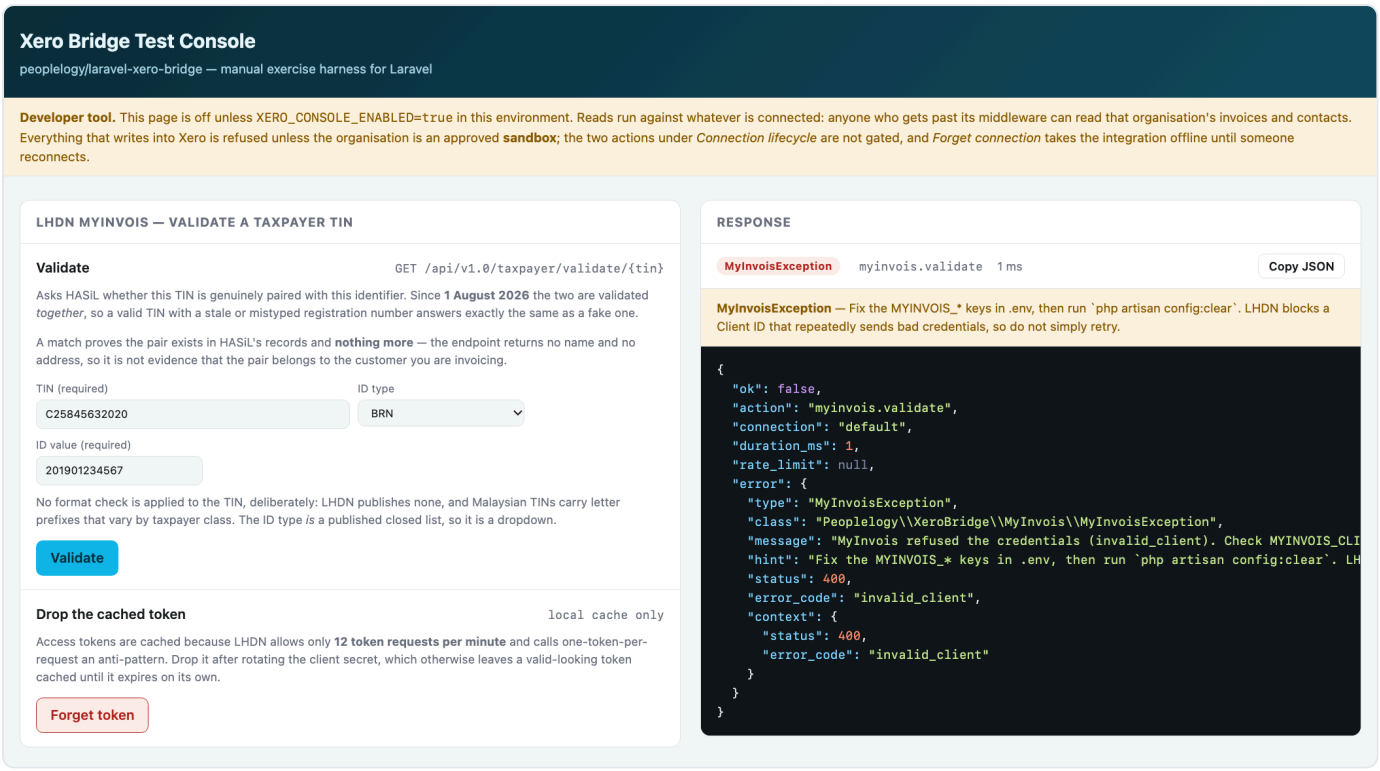

What it means: LHDN answered normally, but it does **not** hold this TIN together with this ID number. The label is still green because this is an answer, not a fault.

What to do:

1. Check the numbers for typing mistakes, extra spaces or dashes.
2. Check the **ID type** — a company needs **BRN**, a person NRIC or passport.
3. For a company, make sure the BRN is the **new 12-digit** SSM number, not an old short one. This is the most common reason for "no match" with a genuine TIN.
4. If it still does not match, ask the customer to confirm their current TIN and registration number, and that LHDN holds them correctly. Do not keep re-trying the same numbers.

When the page shows an error

A **red label** at the top of the Response panel, with a **yellow note** underneath, means LHDN could not give an answer. Nothing is wrong with the customer's details — the problem is with the connection to LHDN. The yellow note says what to do.

What the response says	What it means	What to do
"refused the credentials (invalid_client)"	The application's LHDN login details are wrong, or belong to LHDN's test system instead of the live one (or the other way round)	**Stop** and tell your administrator. Do **not** keep clicking Validate — LHDN can block the account after repeated refusals
"MyInvois is disabled" or **"is missing"** / **"placeholder"**	The LHDN connection is switched off or not set up in this system	Tell your administrator
Status 429 or "rate-limiting"	Too many checks in the last minute (the limit is 60 per minute for the whole application)	Wait a minute, then try once more
Status 500 or 503	LHDN's system is having problems	Try again later
Status 403	The application is not registered for LHDN's TIN-check service	Tell your administrator
A message about a **"connection"** or **"timed out"**	The application could not reach LHDN	Try again later; if it keeps happening, tell your administrator

When you report a problem, use the **Copy JSON** button at the top right of the Response panel and paste the result into your message. It contains everything the administrator needs — but if the check was for a **person**, remove their IC or passport number before sending it on.

The Forget token button

Below the Validate section is **Drop the cached token**, with a red **Forget token** button. You do **not** need it for normal checks.

It clears the application's saved LHDN login so the next check signs in again. Use it **only when your administrator asks you to** — usually right after they have changed the LHDN login details. Clicking it does no harm; the next check simply takes a moment longer.

Is my check saved?

That depends on how your administrator has set up the application. If **check history** is switched on, every check you run is recorded — even ones that showed an error — with:

- **who** ran it (your user account) and **when**;
- the **answer** (match, no match, or the error);
- for a **company (BRN)** check: the TIN and registration number;
- for a **person (NRIC, passport, army)** check: **no numbers at all** — only that a check was made, by whom and with what result. A person's numbers are personal data and are never stored.

Ask your administrator whether it is switched on in your system.

Good practice

- **Check once**, when you first set up a customer or when their details change — not before every invoice. LHDN expects applications to remember the answer rather than ask again and again.
- **Never run many checks quickly in a row.** The limit is 60 per minute for the whole application, shared by everyone using it.
- **Look at** `"environment"` in the response. `production` means the answer came from LHDN's live records. `sandbox` means LHDN's test system: its answers say nothing about real taxpayers.
- **Treat people's numbers with care.** Do not paste IC or passport numbers into chats, emails or screenshots that others can see.
- **A match is not identity proof.** It confirms the numbers are genuine and belong together, not who the customer is.

Quick reference

You see	It means	Do this
Green **ok** + `"matched": true`	Genuine TIN, and it belongs with this ID number	Use the details
Green **ok** + `"matched": false`	LHDN does not hold this pair	Re-check typing, ID type and the 12-digit BRN; then ask the customer
Red label + **invalid_client**	The application's LHDN login is wrong	Stop; tell your administrator
Red label + **429**	Too many checks in a minute	Wait a minute, try once
Red label + **500 / 503**	LHDN is having problems	Try later
404 on the page itself	The page is not switched on here	Ask your administrator
Grey numbers in the boxes	Format examples only	Type the real numbers

---

For your administrator

Everything a developer needs is in the **MyInvois usage** guide in this folder. In short, the panel appears only when all of these are set in the application's environment file:

Setting	Value
`XERO_CONSOLE_ENABLED`	`true` — the console page itself
`XERO_CONSOLE_MIDDLEWARE`	Limit it to admins, e.g. `web,auth,role:admin|super_admin`
`MYINVOIS_ENABLED`	`true`
`MYINVOIS_ENVIRONMENT`	`production` or `sandbox` — **must match the LHDN portal the login came from**
`MYINVOIS_CLIENT_ID`, `MYINVOIS_CLIENT_SECRET`	From the MyInvois portal, under the company's ERP registration
`MYINVOIS_HISTORY`	`true` to record every check (optional; needs its table migrated)

After changing any of them, run `php artisan config:clear` where the configuration is cached.
